

ABSTRACT OF THE DISCLOSURE

An imaging apparatus (10) for exposing an image on a photosensitive media (44) utilizing microcapsules (46) with an image-forming material encapsulated within, image wise exposing desired microcapsules within
5 the photosensitive media with a multiple channel image exposure device to harden the desired microcapsules. Applying pressure with a magnetic rupturing device (50) to the exposed photosensitive media (58) rupturing the unexposed microcapsule (40), releasing an image-forming material encapsulated within to form an image on the photosensitive media.
